Capsicum germplasm resources

- 30 species

Domesticated:

- *C. annuum*
- *C. chinense*
- *C. frutescens*
- *C. pubescens*
- *C. baccatum*

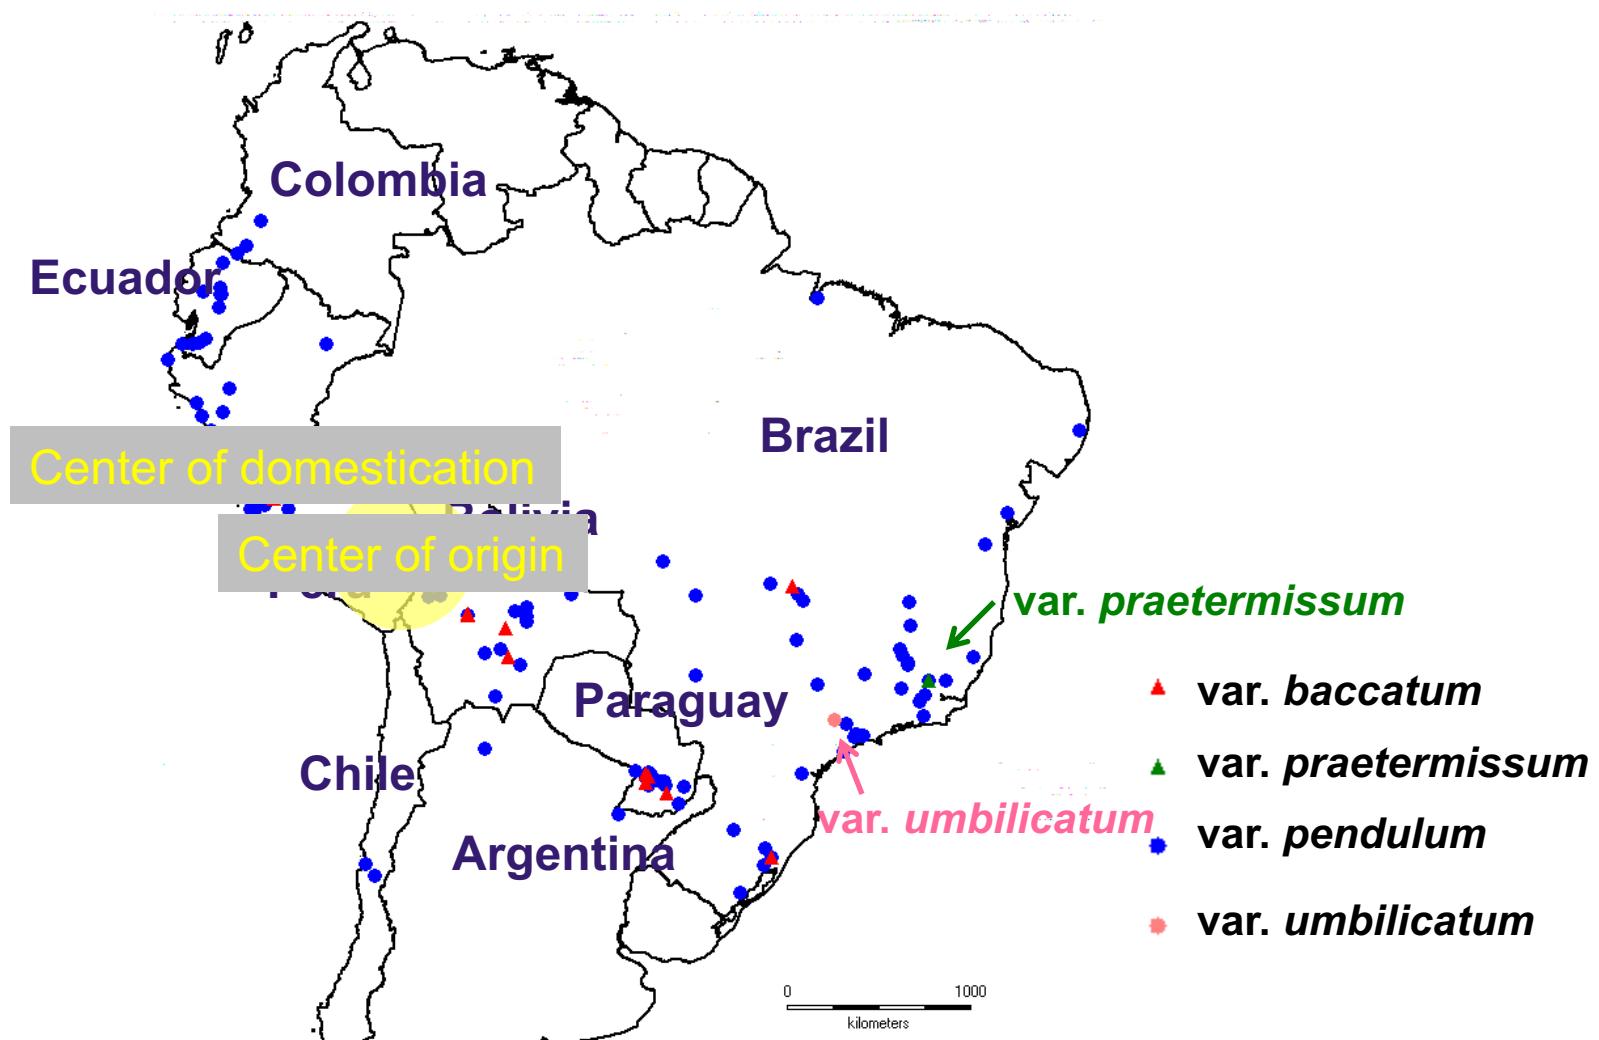

C. baccatum

- var. *baccatum*
- var. *praetermissum*
- var. *pendulum*
- var. *umbilicatum*

C. baccatum - geographic distribution

Objectives

- To characterize genetic diversity and population structure in the *C. baccatum* USDA/ARS germplasm collection.
- To elucidate the species' potential center of domestication and evolutionary history.
- To provide guidance for genetic conservation programs.

Materials and methods

- *C. baccatum* accessions (226)
(5 plants per accession)

C. baccatum var. *baccatum* 20

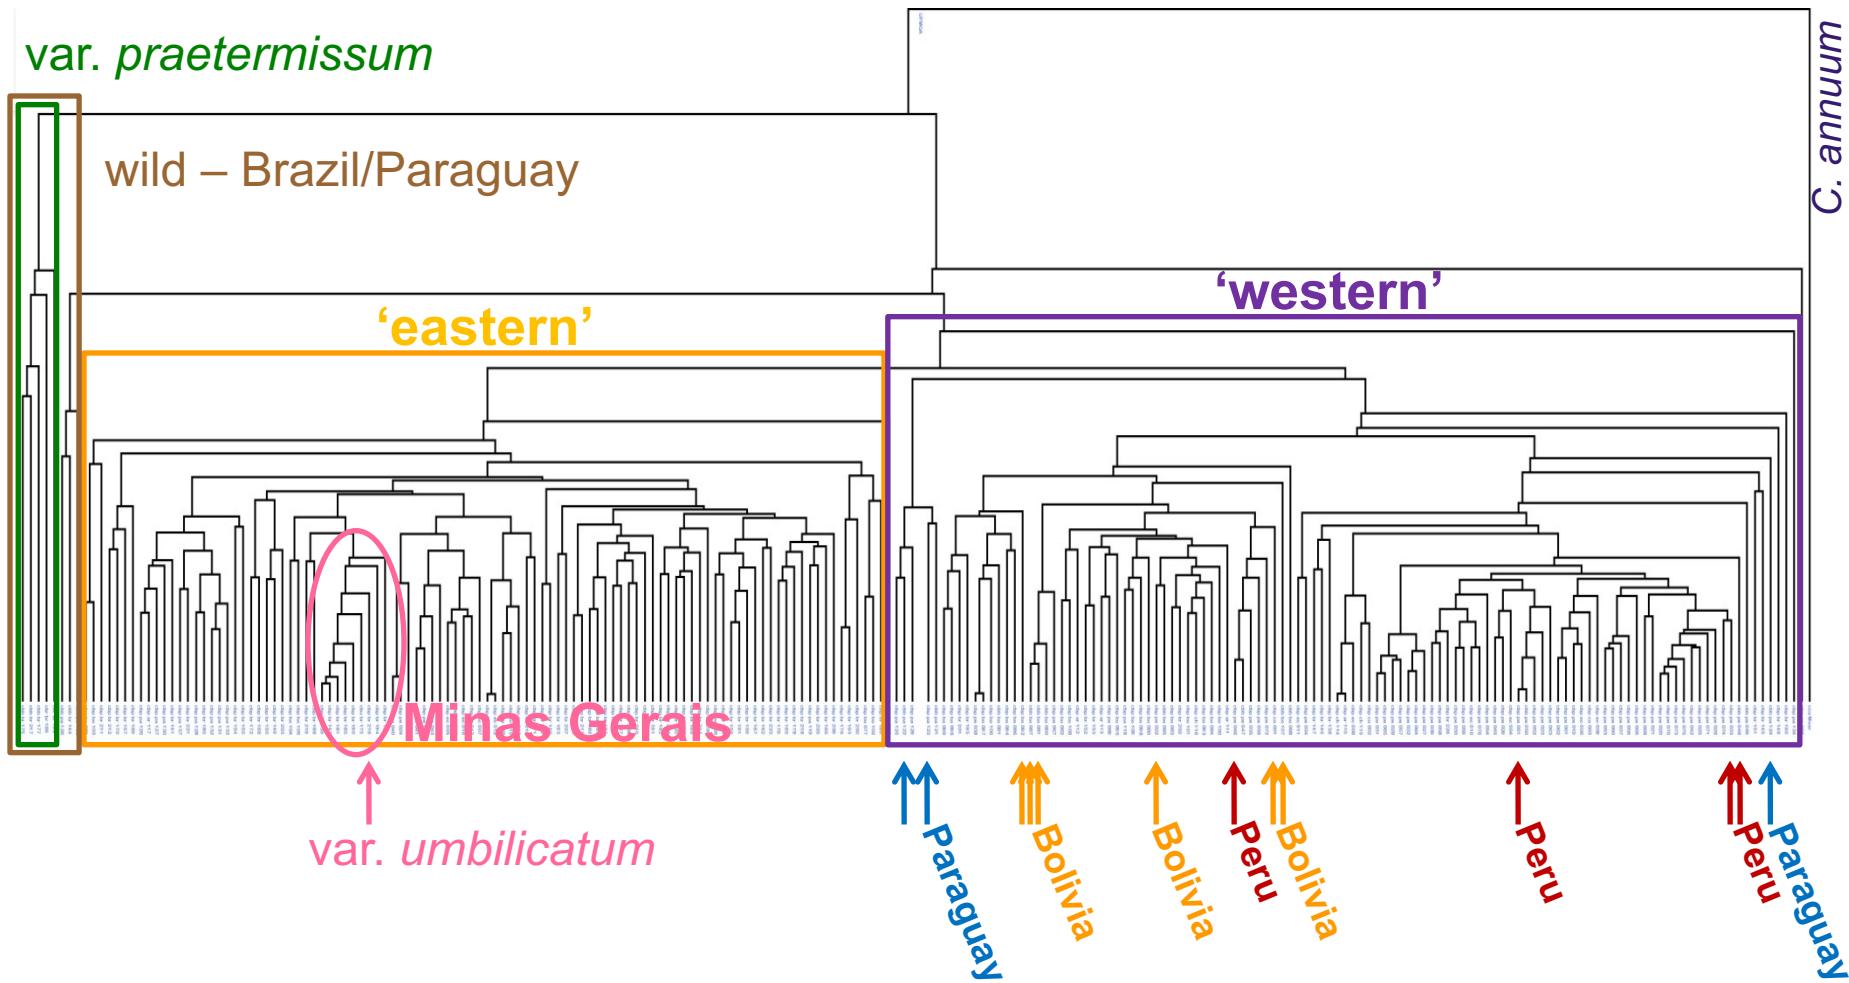

C. baccatum var. *praetermissum* 2

C. baccatum var. *pendulum* 203

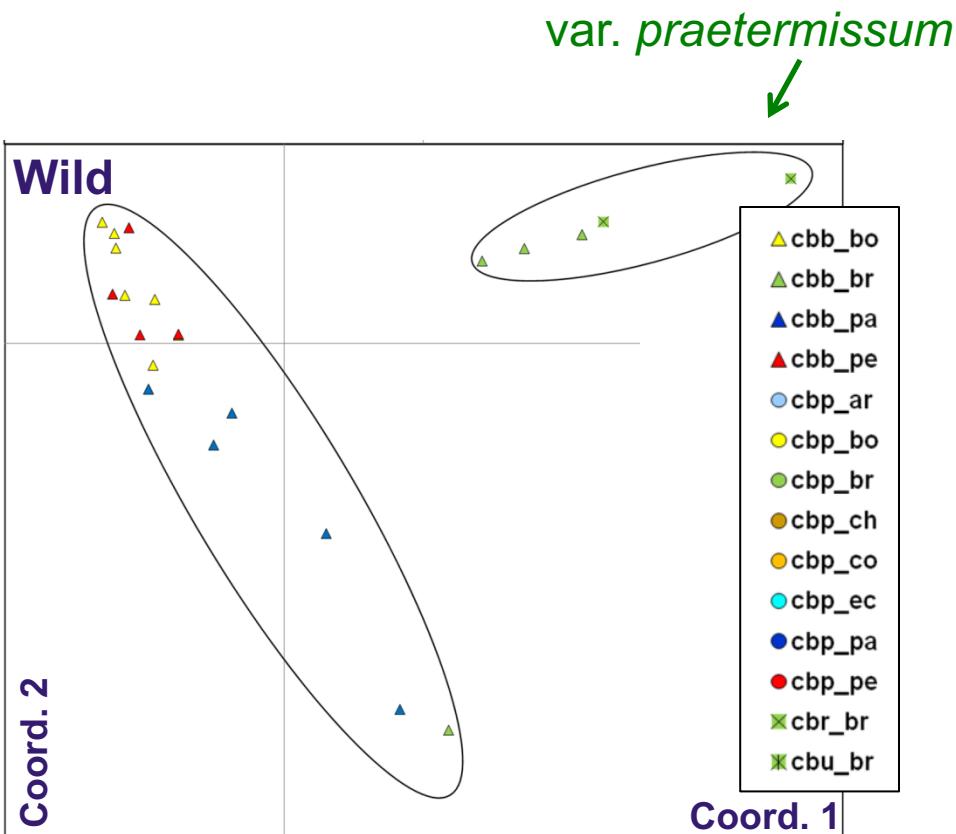

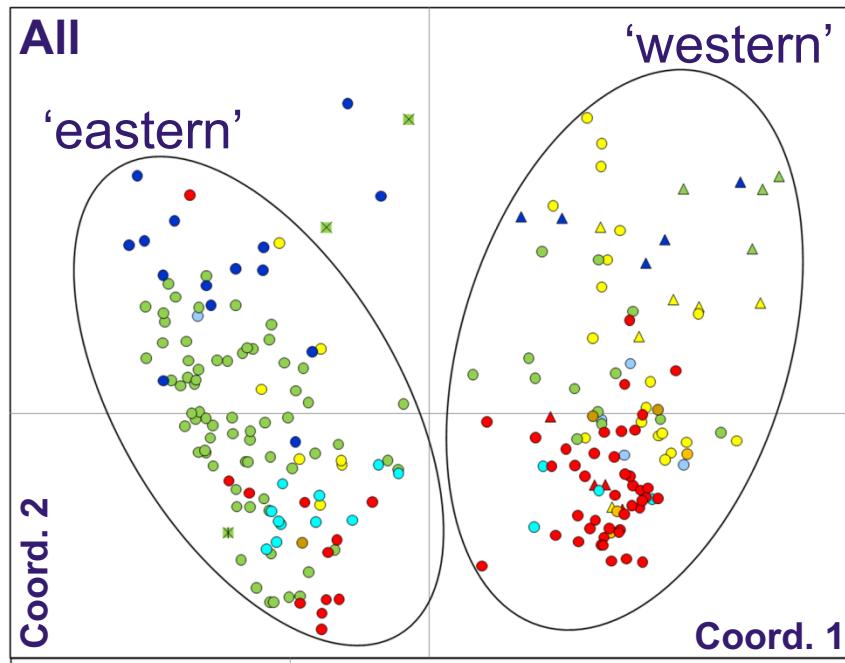

C. baccatum var. *umbilicatum* 1

- AFLP markers (327; two primer combinations)

Distance-based cluster analysis UPGMA dendrogram

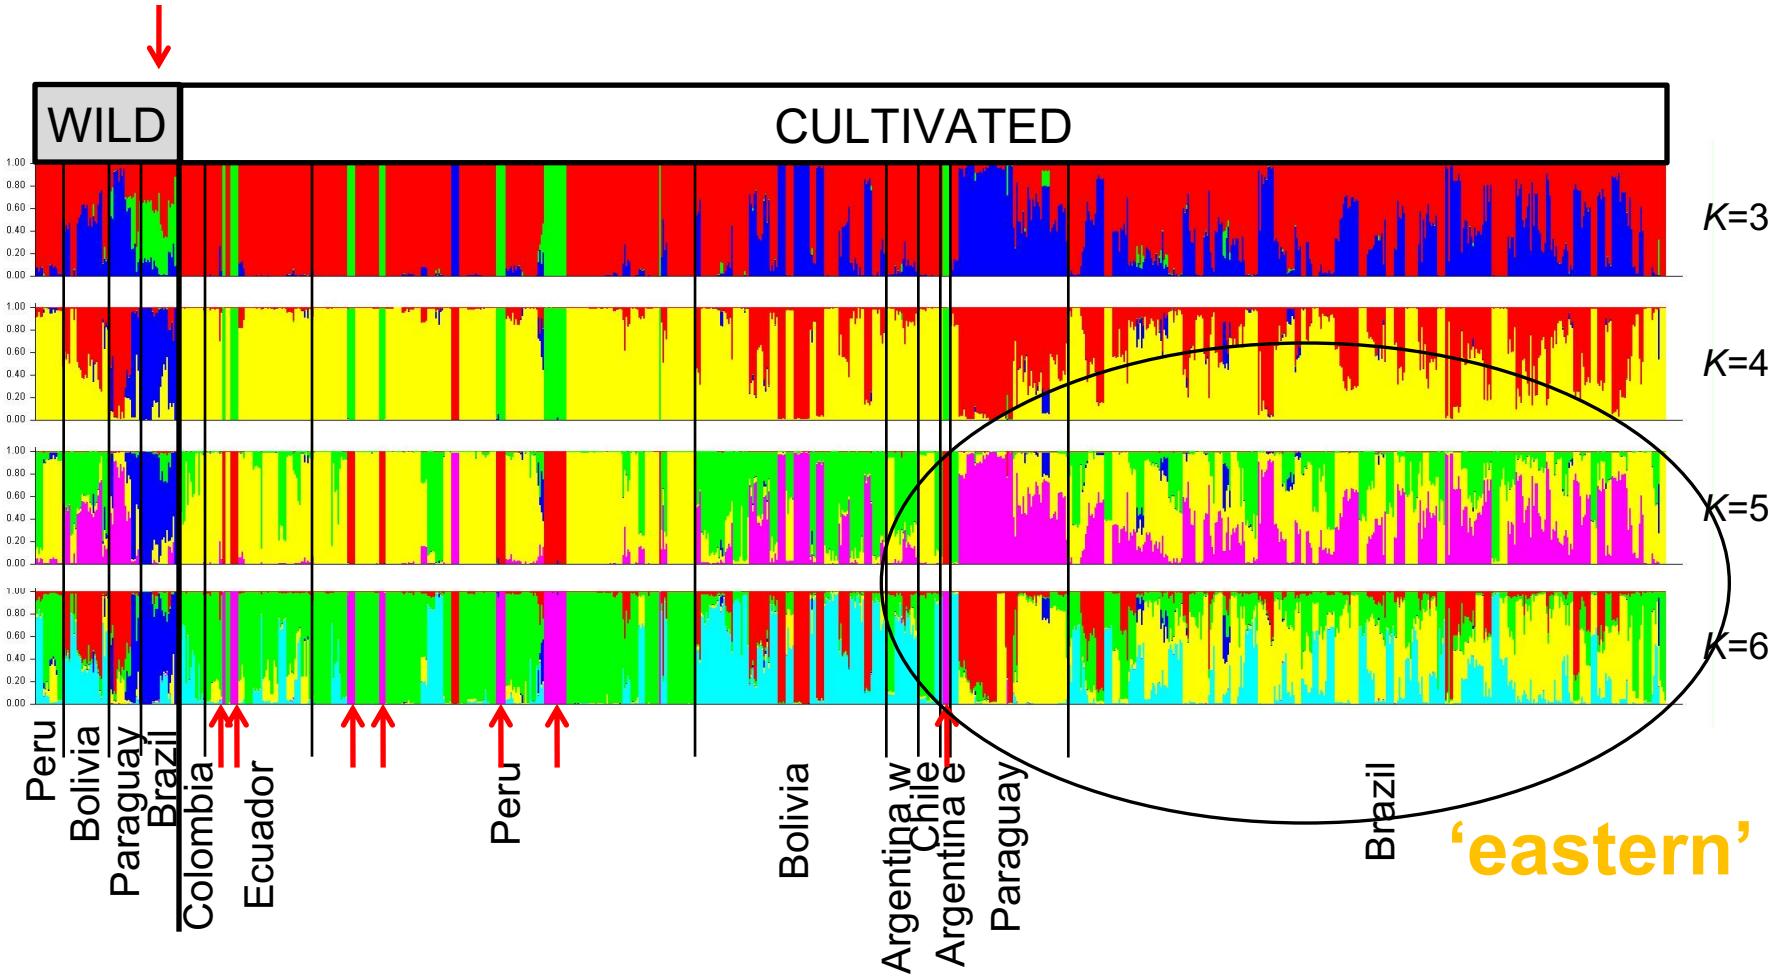

Distance-based cluster analysis Principle Coordinate Analysis (PCoA)

Model-based cluster analysis

STRUCTURE

Conclusions

- Multiple domestication events (from Peruvian/Bolivian and Paraguayan wild types)
- Division of the domesticated *C. baccatum* germplasm into a ‘western’ and an ‘eastern’ group.
- ‘Eastern’ group = hybridization product of various ‘western’ types?
- Reclassification of var. *umbilicatum* into var. *pendulum* OR of var. *pendulum* ‘Minas Gerais’ cluster into var. *umbilicatum*.
- Reclassification of the entire var. *praetermissum* cluster into var. *praetermissum*.

A close-up photograph of a chili pepper plant. The plant has large, green, serrated leaves. Hanging from the stems are several chili peppers in various stages of ripeness: some are bright red, others are a vibrant orange, and a few are still green. The background is blurred, showing more of the plant and the ground.

Thank you for your attention!
